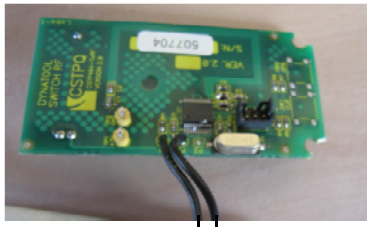
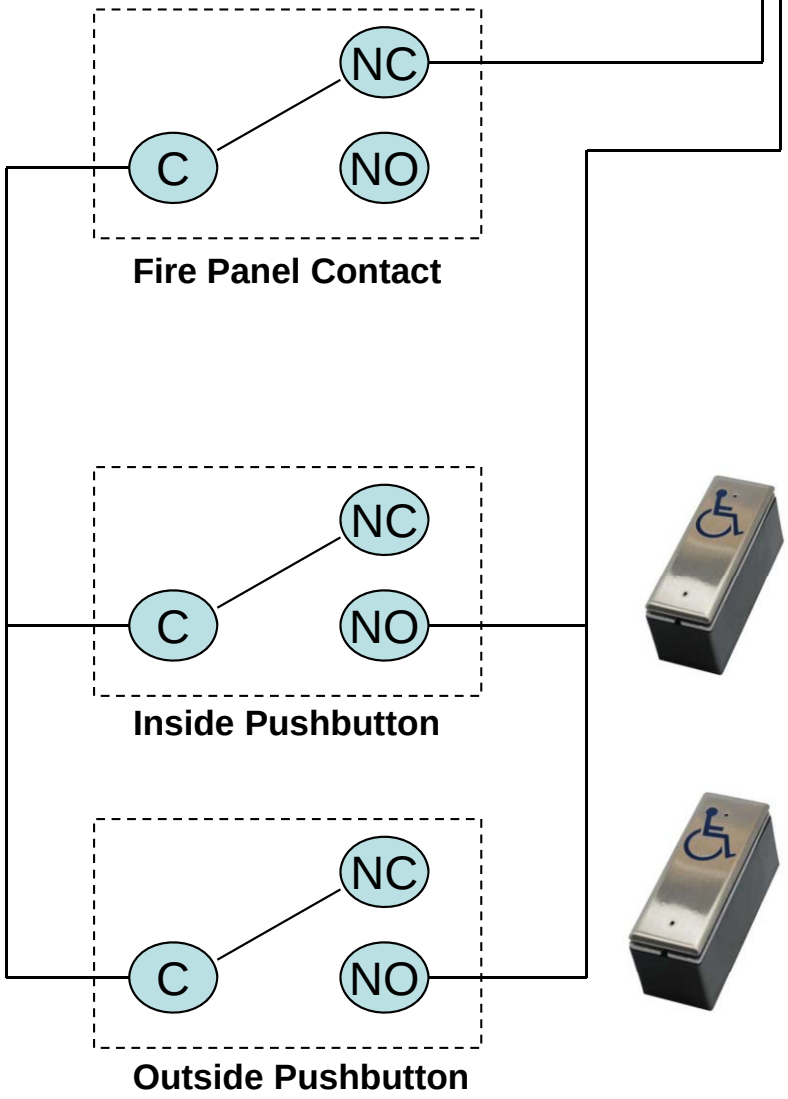
ada ez
WIRE FREE DOOR OPENER

Connecting ADA EZ To a Fire Panel

ADA EZ TX Board



315 MHz RF



System Description:

A normally closed NC contact from the fire panel allows either the inside or outside pushbutton to activate the ADA EZ TX board in turn activating the opener by 315MHz radio frequency signal.

When the fire panel actuates the normally closed contact drops out or opens then neither pushbutton can activate the ADA EZ TX board thus the opener is shut off until the fire panel returns to the NC state.

This allows the ADA EZ to conform to specific sections of The fire code while also allowing the opener to be wire free.

The equipment to make this happen in the field is included in every box.
